The problem

AI agents now do real work.

If an agent can buy a service, who controls what it spends?

Who controls the spend?

How does it choose a provider?

How do we know the work was delivered?

A payment rail is only part of the answer: agents need purchasing rules, financial accountability and evidence.

The differentiator

Most agent payment tools ask

"How does an agent pay?"

Claw Street asks

"What should an agent buy, under whose authority, on what terms, and how do we prove it was delivered?"

How it works

01	02	03	04	05	06
Agent intent	Provider eligibility	Bounded authorization	Execution	Delivery evidence	Financial accounting

Credence checks provider, price limit, facility headroom, evidence tier. Enforced in the backend.

Agent signs outside the browser: prepare, sign, submit.

Scenario A: simulated Nebius, Tier 1.
Scenario B: local Qwen, Tier 2.

Receipts matched, zero failed checks.

Accounting uses tRLUSD, a test asset.

XRPL Testnet proof

Validated on public XRPL Testnet.

D26C5DDC6F51877D745462BD7A6C8C8FE24972137637E2B62D1E269D0F76DE79

tesSUCCESS · VALIDATED

Ledger 21,807,427, confirmed by two separate Testnet nodes

XRPL connectivity proof transaction.
Not governed by Credence procurement authorization.

The demo is settled in Credence's own ledger; purchase-linked on-chain settlement is next.

Built: journal, multisignature, reconciliation.
t54 x402 adapter built (non-paying); QuickNode read-only.

Ledger signing roadmap;
RLUSD target asset.

Claw Street

Agents whose economic actions
can be trusted, verified,
and eventually financed.
